

Setting up Windows to Run Calico Smoothly

Windows 7 has many settings that may conflict with Calico and diminish your design experience. In order to prevent this, we must disable the windows touch settings that are enabled by default.

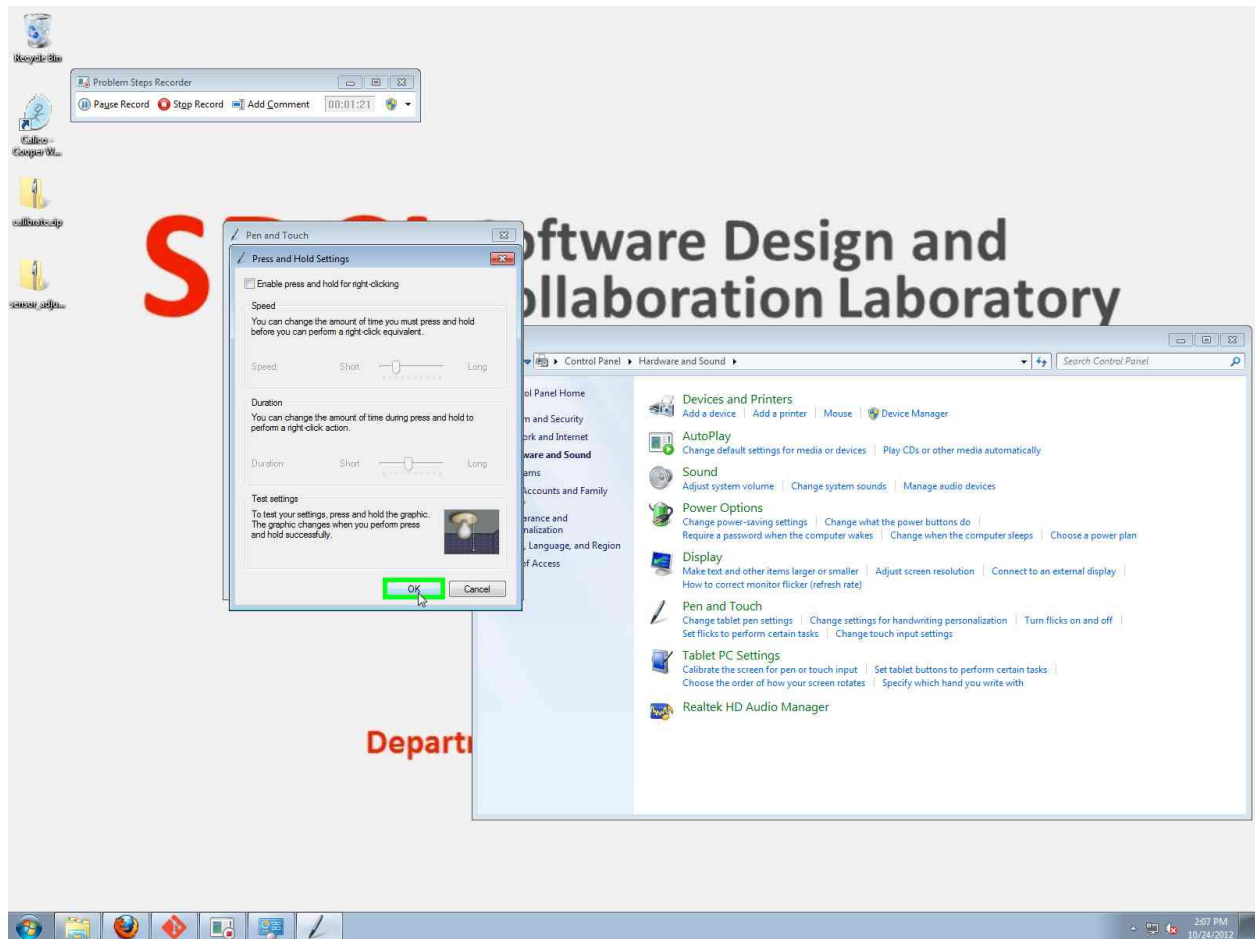

First, navigate to the “Pen and Touch” settings within Control Panel.

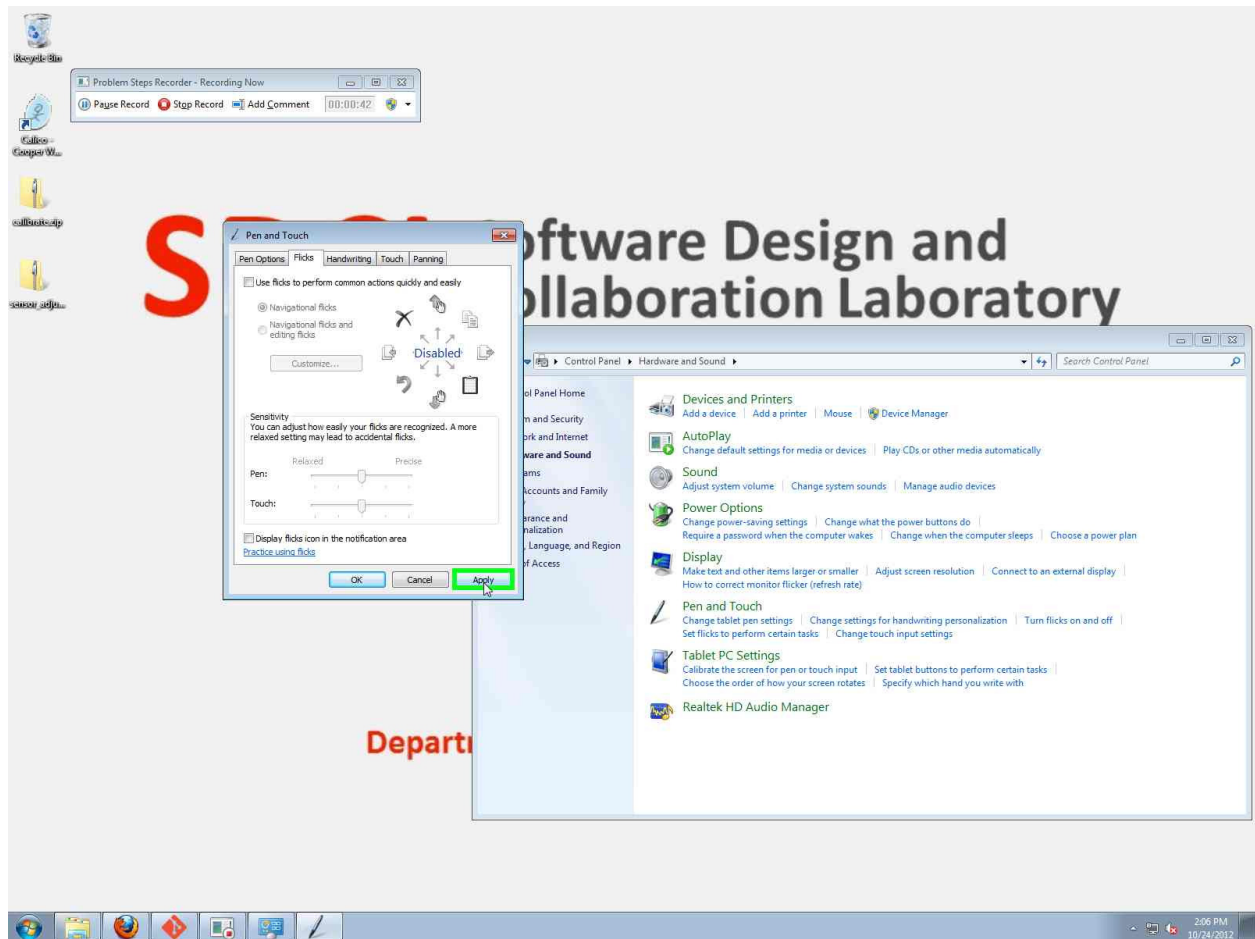

Uncheck both boxes in the “Pen buttons” area.

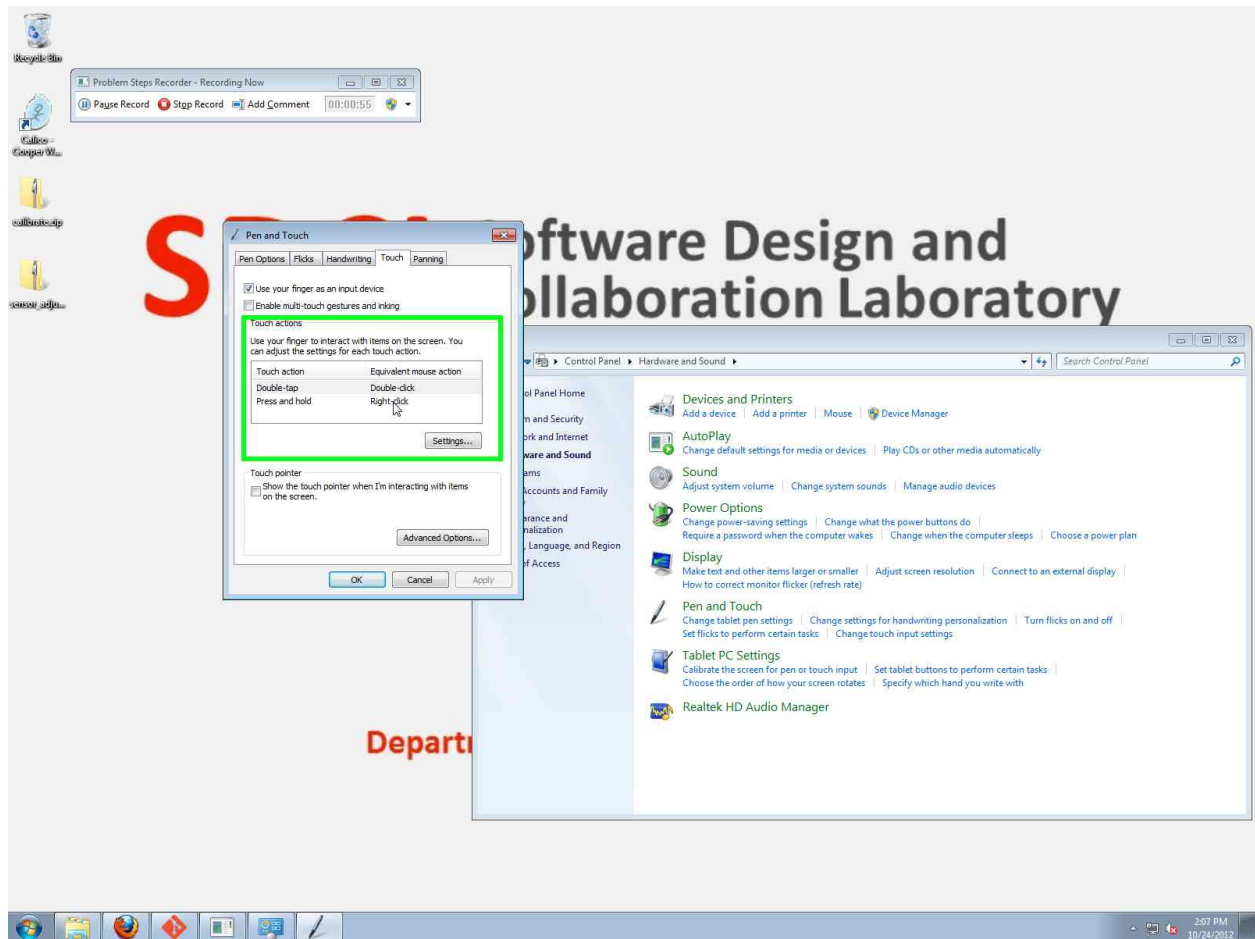

We must also disable “Press and hold”. Inside the “Pen Options” tab, in the “Pen actions” area, select “Press and hold”, and then click “Settings...”

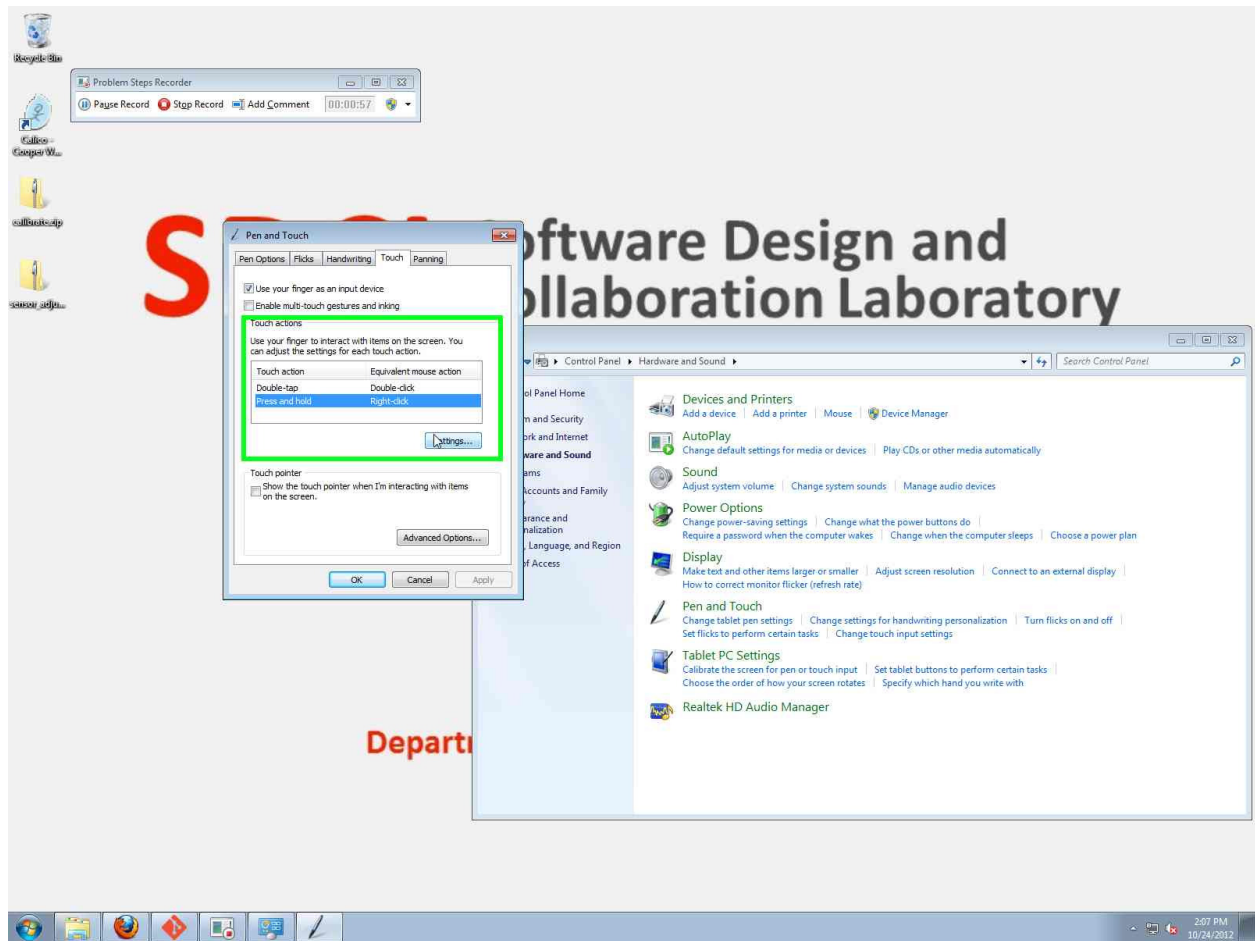

Uncheck “Enable press and hold for right-clicking”, and press “OK”.

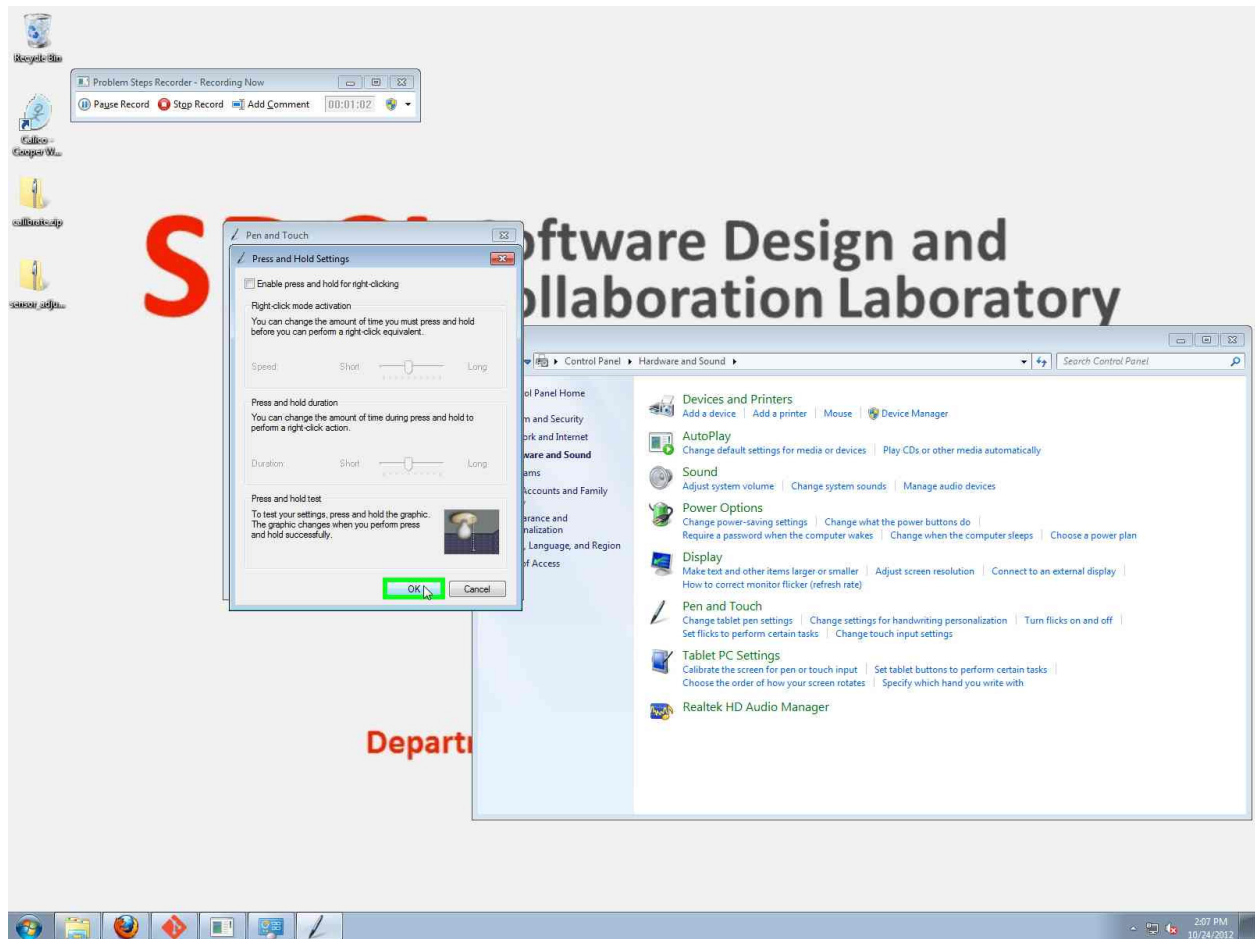

Next we must disable flicks. Navigate to the “Flicks” tab, and uncheck both “Use flicks to perform common actions quickly and easily”, as well as “Display flicks icon in the notification area”. Click apply. *Warning: be sure to click apply before leaving every tab, as settings may not always get saved otherwise.*

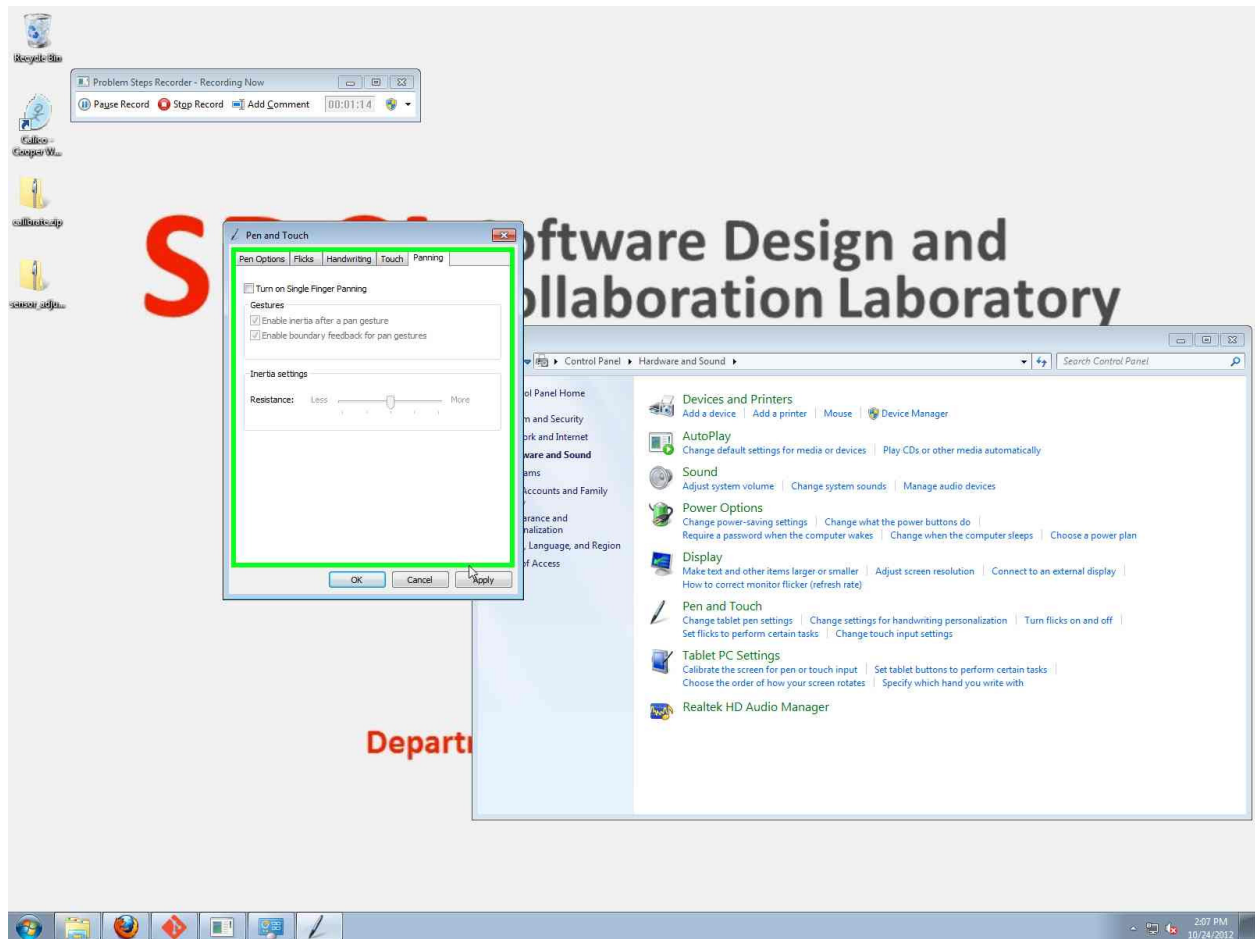

Navigate to the “Touch” tab. If you are using a tablet device with a stylus, we recommend that you disable touch (finger/capacitive touch) input as that may interfere with your sketching when you wrest your palm on the screen.

Disable "Press and hold" within touch. Select "Press and hold", and click "Settings..."

Uncheck “Enable press and hold for right-clicking” and press “OK”.

Panning should also be disabled. Click on the “Panning”, and uncheck “Turn on Single Finger Panning”. Press “Apply” when done.
